Convert RAW PDF files to PROCESSED MD files

To create numeric vectors for our data index we need to provide text files.

Code Organization for Creation of FAISS index

```
rag_313/
|---- data/
|         /processed
|         ....md
|         /raw
|         ....pdf
|---- faiss_index/
|         index.faiss
|         index.pkl
|---- scripts/
|         convert.py
|         ingest.py
|---- app.py
```

Instructions: Running convert.py

1. Download github.com/rebeccapeltz/rag_313 (see video in Section 1 on Python Setup)
2. Change Directory into rag_313-main
3. Open a Terminal
4. Setup Python Virtual Environment
5. `pip install -r requirements.txt`
6. (optional) save data/processed in a separate directory for comparison
7. Delete data/processed (Markdown Files)
8. Change Directory into /scripts
9. Run `python convert.py`
10. Look for Markdown files under `./data/processed`

Next Step: Text Ingestion to Create Index

- **Processed text is ready for “chunking”**
- **Chunks are semantically related information**
- **Ingestion process uses chunks to create an index**
- **Index is like a database that makes chunked data available for creating prompt context**

Data Conversion

At this point, you know how to convert files into a text format from a PDF format. Take time to compare the files you've converted from PDF format to text format.
